Storage Propositions.

This body has been at loggerheads over storage needs; whether there is need for more dams or dam removal more in stream or off stream storage. In lieu of storage prevarication by Darrell's one should look at how Calfed, which has been a topic today, has managed to find a long term solution.

Calfed Science program has been criticized for doing perpetual studies with little influence or impacts or relevance to the Bay Delta. Wrong, it has been determined that its the tails' movement that propels fish. By extension it is observed that happy dog's who wag their tails, move at a faster rate. The California State Park or Park system, especialy with Bond issuance and approval, is a major mover of the State's water system.

This movement of the appendage upon the project is best shown in where water accrues and is stored - Visitor Centers funded by Calfed. This will increase as all Colly fornia drives hydrogen powered cars to visit these centers. The byproduct of hydrogen combustion is water so provision should be made at Visitor Centers to store it

Parks + Calfed should be applauded for finding and setting this priority since both the Department and the water stakeholders there assembled have not and, it may be assumed will not convey to the public that it is a stakeholder in water and should support water as a necessary natural resource, not as a funding mechanism for human services.
